

SEP 7: Uniform Resource Identifier scheme to Facilitate Delegation (created 7/8/2018)

- Introduces a URI scheme ("web+stellar:") for initiating Stellar transactions, enabling easy integration with web browsers and applications. Explains the format and parameters of the URI, covering transaction signing, callbacks, network specification, and security considerations.
- This Stellar Ecosystem Proposal introduces a URI Scheme that can be used to generate a URI that will serve as a request to sign a transaction.
- No ambiguity to what is going on in the Stellar Matrix. URI's will be able to create 3rd party systems to hold secret keys.
- 4 Criterias: (Next gen satellite crypto wallets, Biometrics, QKD)
1) Open and Decentralized 2) Secure 3) Standardized 4) Future Proof
- Every single transaction is monitored, vetted and must be verified with generative AI that searches for anomalies.
- Callback error = if there is suspicious activity or a transaction can not be KYC'd, the transaction is paused and gets flagged and re-KYC'd.
