

SEP 10: Stellar Web Authentication (created 31/7/2018)

- This SEP defines the standard way for clients such as wallets or exchanges to create authenticated web sessions on behalf of a user who holds a Stellar account.
- Connected to Red Hat- Red Hat device edge integration to push upgrades without having to reprogram each server individually.
- Redirects existing or 3rd party servers to any quantumly secured server.
- Muxed Accounts: accounts that exist virtually under traditional Stellar address for multiple sub wallets designated with M instead of G. Removes the need for memos.
