

Stellar Ecosystem Proposals (SEPs)

Per SDF's definition, SEP is a distinct blueprint meant to help users build a product or service that interoperates with other products and services on the Stellar network. Anytime you want your product or service to interoperate with other products or services in the ecosystem, you must create additional infrastructure to handle those interactions. SEPs define standards for building that infrastructure on the Stellar network through a single common integration. In essence, SEPs define what qualifies as credible/authorized interactions and interoperability on Stellar, and also cancels out what is not.
